

AGENTICBRO

AI SCAM DETECTION ECOSYSTEM

OUR MISSION

Make Web3 & Social Layer safer for everyone.

SCAN FIRST. TRUST LATER. STAY SAFE.

ONE SHIELD. TOTAL PROTECTION.

Protecting you across **Web3** and the **Social Layer** from every type of scam.

TOKEN SCANNER

Detects risky token contracts, honeypots, high tax & more.

RISK SCORE **9.2/10** **HIGH RISK**

WEBSITE SCANNER

Scans websites for phishing, malware, fake dApps & dangerous scripts.

RISK SCORE **9.3/10** **HIGH RISK**

AIRDROP SCANNER

Identifies fake airdrops and wallet drainers. Stay safe, claim smart.

RISK SCORE **9.5/10** **HIGH RISK**

WALLET PROTECTOR

Real-time transaction analysis & approval protection.

TRADING PLATFORM SCANNER

Exposes fake trading platforms and scam brokerages.

RISK SCORE **9.4/10** **HIGH RISK**

SOCIAL + COMMUNITY PROTECTION

Scan users across platforms. Detect scam patterns before they reach you.

Scammers Indexed	Passing Tests	CDP Extraction Accuracy	On-Chain Detection — Competitors	Scan Surfaces	Automated Cron Pipelines

"AgenticBro is a production-deployed scam detection system powered by Jeeevs — an autonomous security agent that uses Chrome DevTools Protocol browser automation and local Ollama inference to scan social web profiles, detect token impersonation, and maintain a live database of 261+ confirmed scammers across 7 attack surfaces. Phone, wallet, and website scanning extend protection beyond the social layer. The DePIN network is the next step."

Version 2.3 · May 2026 · agenticbro.app

Sources: Chainalysis 2025 Crypto Crime Report; SlowMist Hacked Database; Guardioo Labs 2026 Agentic AI Security Report

1. Executive Summary

Social engineering attacks are the dominant threat vector in Web3. In 2025 alone, over \$1.1 billion was stolen through fake influencer promotions, phishing Discord raids, impersonator Twitter accounts, and rug-pull Telegram communities — not through smart contract exploits, but through human deception. On-chain analytics cannot see this attack surface. Wallet monitors cannot see it. Only an agent watching the social web in real time can.

AgenticBro v2.3 documents that agent in its current, deployed form: a single-node detection system built on TypeScript / Node.js, powered by Chrome DevTools Protocol (CDP) browser automation, and running local AI inference via Ollama. The system is not a concept or a roadmap item — it is running today, with 85+ passing unit tests, REST API endpoints, a scammer database of 261+ confirmed entries, and real-time scanning across Twitter/X, Telegram, Facebook, Instagram, LinkedIn, TikTok, Solana token markets, phone numbers, and websites.

AgenticBro v2.3 extends the detection stack with three new capabilities: (1) the Wallet Transfer Scanner, which traces \$AGNTCBRO token movement and wallet exposure on Solana mainnet via load-balanced RPC; (2) the Website Deep Scanner, which performs multi-source reputation analysis on arbitrary domains via a 15-minute processing queue; and (3) the X Engagement Monitor, an automated outreach intelligence system that identifies current crypto scam victims and safety discussions across social platforms for targeted community intervention. The scammer database has grown to 261+ confirmed entries — a 49% increase since v2.1. The system now operates 5 automated cron pipelines alongside a continuously running Telegram community agent.

~15s	<22min	~8%	340+	<3s	30-60s
Profile Scan Latency	First Signal to Alert	False Positive Rate	Campaigns Tracked/Node	Wallet Scan Latency	Website Deep Scan

2. The Problem: The Invisible Attack Surface

The security tooling industry has poured billions into on-chain analytics — transaction graph analysis, wallet clustering, MEV detection, smart contract auditing. These tools are valuable. They are also completely blind to where most of the money is actually being stolen.

2.1 Anatomy of a Modern Web3 Scam Campaign

- A team of 5–20 operators creates 200–2,000 'aged' social media accounts on Twitter/X, Telegram, Discord, and YouTube across a 4–12 week coordinated preparation period.
- A credible-sounding project identity is manufactured: professional website, realistic GitHub activity, fake audit certificates, and purchased follower counts. AI-generated founder avatars pass basic reverse-image searches.
- Influencer accounts are either purchased, compromised, or impersonated. AI voice cloning replicates recognizable personalities in YouTube Shorts and Spaces.
- A coordinated shill campaign floods relevant Discord servers, Reddit communities, and Twitter with organic-looking engagement. Fake community members answer questions authoritatively.
- A token launch or NFT mint is announced. Real users — seeing apparent grassroots excitement — invest. Funds are extracted. Accounts vanish within 48–72 hours.

The Core Insight: Scammers don't hack blockchains. They hack people. Stopping them requires watching behavior across the social web — in real time, at scale, with behavioral AI that understands manipulation patterns.

2.2 Why Existing Solutions Fail

Solution Category	What It Monitors	What It Misses
On-Chain Analytics (Chainalysis, Nansen)	Transaction graphs, wallet clusters, token flows	All pre-launch social engineering; influencer fraud; fake community building
Smart Contract Auditors (CertiK, Hacken)	Solidity/Rust code vulnerabilities	Rug pulls using valid contracts; social layer attacks
Browser Security Extensions	Known phishing domains, approval patterns	Novel domains (avg lifespan: 6hrs); impersonator accounts; deepfakes
AI Chatbots / LLMs	Reactive Q&A; from known data	Real-time behavioral signals; coordinated account networks; live campaigns
Manual Reporting	User-flagged content	Too slow (hrs–days); easily circumvented; no cross-platform correlation

3. The Solution: Single-Node Architecture

AgenticBro v2.3 is a fully deployed, single-machine security stack. The entire detection pipeline — from browser automation to database sync — runs on one node. This is the Proof of Concept that validates the detection methodology before network expansion.

3.1 Repository Structure

Directory	Purpose
/workspace/agentic-bro/	Main backend service: profile verifier, API routes, scam detection services, Chrome CDP clients, test suites
/workspace/scam-detection-framework/	Documentation and methodology: 10 markdown files, 3,993 lines covering all detection approaches
/workspace/scammer-detection-service/	Scammer detection service code with token scanner and database sync utilities
/workspace/aibro/	Frontend website (aibro repo, pushed to GitHub separately)
/workspace/scammer-database.csv	Master scammer database — 261+ confirmed entries with 15-field schema

3.2 Scan Commands — 12 Platforms

Platform	Command	Method
X/Twitter (CDP)	bash /workspace/scripts/scan-x-cdp.sh "@handle"	Chrome CDP port 18801
Instagram	bash /workspace/scripts/scan-instagram.sh "username"	HTTP API scraping
TikTok	bash /workspace/scripts/scan-tiktok-command.sh "username"	HTTP API scraping
Facebook	bash /workspace/scripts/scan-facebook.sh "username"	HTTP API scraping
LinkedIn	bash /workspace/scripts/scan-linkedin.sh "username"	HTTP API scraping
Telegram	bash /workspace/scripts/scan-telegram.sh "username"	Web fetch + CDP
Phone	bash /workspace/scripts/scan-phone.sh "+14158586273" US	Numverify + 12-flag scoring
Wallet	bash /workspace/scripts/scan-wallet.sh "wallet_address"	Solana RPC load balanced
Website	Submit at agenticbro.app	Queued deep scan (15min)
Ticket Site	bash /workspace/scripts/scan-ticket-site.sh "url"	Domain + pattern analysis
Universal	bash /workspace/scripts/scan-source.sh "platform" "username"	Platform router
Web Search	bash /workspace/scripts/local-web-search.sh "query"	DDG/SearXNG/Google

3.3 Technology Stack

Layer	Technology	Version / Notes	Status
Runtime	Node.js + TypeScript	Node 18+, TypeScript 5.3+	Active
Web Framework	Express.js	4.18.2 — REST API on port 3002	Active
Browser Automation	Puppeteer + Chrome CDP	24.4.0 — Primary port 18801; secondary 18800, 18000, 18001	Active
Local AI Inference	Ollama	Metal (Mac), CUDA (NVIDIA), ROCm (AMD)	Active

Database	PostgreSQL + Supabase	PostgreSQL 15+, port 5432	Active
Cache / Queue	Redis	7+, port 6379, via ioredis 5.3.2	Active
Testing	Jest + ts-jest	85+ tests, 10s timeout, coverage reporting	Active
Containerization	Docker Compose	API + Worker + PostgreSQL + Redis	Active
Web Search	DDG/SearXNG/Google scraping	API-free, UA rotation, 1hr cache	NEW v2.3
Wallet Scanner	Solana JSON-RPC	Chainstack primary + public RPC fallback	NEW v2.3
Cron Scheduler	OpenClaw Cron	5 active pipelines	NEW v2.3
Deep Scan Queue	Supabase + Express	15-min processing cycle	NEW v2.3

CDP Port Update: Chrome CDP primary port has been consolidated to **18801** for all X/Twitter scanning operations. Secondary ports (18800, 18000, 18001) remain available for parallel scan operations.

4. Scam Detection: Technical Architecture

AgenticBro's scam detection pipeline is built on a single foundational insight: coordinated inauthentic behavior has a signature. Individual signals may be ambiguous; correlated signals across platforms, time, and account networks are not. The architecture surfaces those correlations in real time.

4.1 Chrome CDP: The Social Web Sensor

Chrome DevTools Protocol (CDP) is the foundational scanning technology. Unlike simple API polling, CDP gives AgenticBro full browser-native access to page content, network requests, and DOM events — allowing it to observe platforms exactly as a human user would, including content not exposed through public APIs.

Configuration	Value
Primary CDP Port	18801 (consolidated in v2.3)
Secondary Ports	18800, 18000, 18001
Target Platforms	X.com (Twitter) — primary; Facebook, Instagram, LinkedIn, TikTok supported
Scan Duration	~15 seconds per profile
Extraction Accuracy	95%+
Cost	Free — no API rate limits, no per-query fees
Auth Method	Authenticated browser session (real user session cookies)

4.1.1 Data Points Extracted per Profile

Data Field	Extraction Method	Reliability
Verified (Blue Check)	DOM: [data-testid='verificationBadge']	100%
Verified Since Date	Regex: /Verified since (\w+ \d{4})/	95%
Username / Display Name	DOM extraction	100%
Biography Text	DOM extraction	100%
Followers / Following / Posts	DOM numeric extraction	95%
Account Join Date	DOM aria-label parsing	95%
Recent Tweets (first 3)	DOM text extraction	90%

4.2 Profile Verification Service (85+ Tests)

The profile verifier accepts a username and context, fetches profile data via Chrome CDP, runs a weighted red-flag scoring algorithm, and returns a structured authenticity report. Scores are computed on a 90-point scale then normalized to 0–10.

Red Flag	Weight	Detection Method
Guaranteed Returns Claims	15	Keyword search in bio/posts
Private Alpha / Insider Access	15	Keyword search
Unrealistic Performance Claims	15	Context + keyword analysis
Paid Shill Account Patterns	15	Cross-signal pattern matching
Urgency Tactics	10	Keyword search (limited time, now, fast)
No Track Record (new account)	10	Account age check vs join date
Requests Crypto Deposits	10	Keyword search (send, deposit, invest)

No Platform Verification	10	Badge check via DOM
Fake Follower Ratio	10	Followers/Following ratio analysis
New Account (<30 days)	10	Join date delta calculation
VIP Upsell / Premium Group	10	Keyword search
High-Risk Token Promotion	10	Content + contract address detection

Risk Score	Risk Level	Action
0.0 – 3.0	LOW	Safe to engage, may be a legitimate partner
3.0 – 5.0	MEDIUM	Exercise caution, request additional verification
5.0 – 7.0	HIGH	Strong scam indicators — avoid financial engagement
7.0 – 10.0	CRITICAL	Confirmed scam pattern — block and report immediately

4.3 Token Impersonation Scanner

Risk Factor	Score	Description
Exact symbol match to legitimate token	+5	Identical ticker symbol detected
Symbol contains legitimate token symbol	+3	Partial match (e.g., 'XAGNT' vs 'AGNT')
Name contains legitimate token name	+3	Similar project name branding
Zero liquidity pool	+2	No trading possible — honeypot indicator
Very low liquidity (< \$100)	+1	Negligible trading depth
Very low volume (< \$10)	+1	No organic trading activity
Launched on Pump.fun	+1	High-velocity meme token launchpad

4.4 Telegram Bot Scam Detection

Bot Scam Type	Max Weight	Critical Trigger
Impersonation Bots	+10	Username/name similarity to official bots
Wallet Drainer Bots	+12	Any private key / seed phrase request — CRITICAL
Giveaway Scam Bots	+8	'Send X, receive 2X' message patterns
Support Scam Bots	+7	Requests for password, 2FA codes, or KYC docs
Airdrop Scam Bots	+7	Airdrop claim + wallet connection requirement
Investment Scam Bots	+9	Guaranteed returns / daily profit claims

CRITICAL PRIVATE KEY DETECTION: Any detection of "private key," "seed phrase," "mnemonic phrase," "recovery phrase," "wallet.json," or "full wallet export" triggers an IMMEDIATE CRITICAL RISK (10/10).

NEW IN v2.3

4.5 Wallet Transfer Scanner — NEW in v2.3

The Wallet Transfer Scanner extends AgenticBro's protection to the on-chain layer. While the profile verifier and phone identifier operate at the social and voice layers respectively, the wallet scanner provides direct visibility into token movement patterns — identifying holder concentration, dump patterns, and wallet exposure risk for \$AGNTCBRO and any Solana token.

4.5.1 Capabilities

Feature	Description
Wallet Balance Lookup	Real-time SOL and SPL token balance for any Solana address
\$AGNTCBRO Holder Verification	Confirms token holdings via on-chain data (no trust required)
Transfer History	Recent transaction analysis with token-specific filtering
RPC Load Balancing	Chainstack primary with public RPC fallback — resilient to endpoint failures
Holder-Only Scan Tier	Token-gated: \$100+ \$AGNTCBRO hold = 50 scans/month

4.5.2 Technical Architecture

- **RPC Layer:** solana-rpc.sh load balancer — Chainstack private endpoint (primary), public Solana RPC (fallback)
- **Token Detection:** getTokenAccountsByOwner JSON-RPC with mint filter for 52bJEa5NDpJyDbzKFaRDLgRCxALGb15W86x4Hbzopump
- **Transaction Parsing:** getSignaturesForAddress + getTransaction for recent transfer extraction
- **Output Format:** Structured terminal report with wallet address, AGNTCBRO holdings, recent transfers, and risk indicators

4.5.3 API Endpoints

Method	Endpoint	Description
POST	/api/v1/scan/wallet	Full wallet risk scan for a Solana address
GET	/api/v1/wallet/:address/latest	Retrieve latest wallet scan result

CLI: bash /workspace/scripts/scan-wallet.sh <wallet_address>

NEW IN v2.3

4.6 Website Deep Scanner — NEW in v2.3

The Website Deep Scanner performs multi-source reputation analysis on arbitrary domains. It combines web search intelligence with structured risk scoring to detect phishing sites, fake event ticket platforms, impersonation domains, and fraudulent e-commerce operations.

4.6.1 Architecture

- **Processing Queue:** Supabase-backed job queue. Users submit domains via agenticbro.app. Pending jobs processed every 15 minutes by the deep-scan processor cron.
- **Step 1:** Domain submitted → queued in Supabase scan_jobs table
- **Step 2:** Deep-scan cron polls for pending jobs
- **Step 3:** Multi-source web search: "{domain} scam legit review regulatory warning"
- **Step 4:** Risk extraction from search results (scam reports, regulatory warnings, community reviews)
- **Step 5:** Structured result returned with riskScore, riskLevel, scamReports[], scamIndicators[], recommendations[]

4.6.2 Specialized Scanner: Event Ticket Fraud

A dedicated ticket-site scanner targets the fastest-growing consumer fraud vector of 2026:

- **Focus:** World Cup 2026, Copa America, and major sporting event ticket scams
- **Detection:** FIFA impersonation, suspicious payment methods, urgency tactics, known scam domain matching
- **CLI:** bash /workspace/scripts/scan-ticket-site.sh <url>

4.6.3 API Endpoints

Method	Endpoint	Description
POST	/api/website-deep-scan	Submit domain for deep scan (queued)
GET	/api/website-deep-scan?pending=true	Poll pending scan jobs
POST	/api/website-deep-scan (result)	Submit completed scan result

Cron Schedule: Every 15 minutes, staggered by ±5 min random jitter

NEW IN v2.3

4.7 X Engagement Monitor — NEW in v2.3

The X Engagement Monitor is an automated outreach intelligence system. It identifies current crypto scam victims, safety questions, and security discussions across social platforms — delivering actionable engagement targets to the AgenticBro team for targeted community intervention.

4.7.1 Search Strategy

The monitor uses time-aware, dynamic queries that inject current month/year to ensure fresh results:

- "got scammed" OR "got rugged" solana crypto [CURRENT MONTH YEAR]
- "is this a scam" OR "is this legit" solana crypto [CURRENT YEAR]
- solana wallet drain scam phishing [CURRENT MONTH YEAR]
- meme coin rug pull solana [CURRENT YEAR]
- crypto scam warning [CURRENT MONTH YEAR]

4.7.2 Three-Tier Search Pipeline

Priority	Method	Use Case
1 — Primary	Chrome CDP (port 18801)	Auto-scraping X search results — full DOM access, no API limits

2 — Fallback	Local Web Search	DDG/SearXNG/Google scraping — fallback when CDP unavailable
3 — Manual	Manual URL Generation	Pre-formatted X search URLs for manual review

4.7.3 Relevance Scoring

- Mentions current month/year → +2
- Solana-specific → +2
- Active scam/rug pull report → +3
- Person asking for help → +3

4.7.4 Engagement Types

Type	Description	Example
scam_victim	User reporting they were scammed	"Just got rugged on [token]"
safety_question	User asking if something is legit	"Is [project] a scam?"
security_awareness	Educational content about scams	"How to spot rug pulls"
meme_caution	Cautionary meme/humor about scams	Meme about getting rekt

Output: Top 5-7 targets delivered to Telegram DM daily at 9:00 AM EST with URL, engagement type, and one-line summary.

Cron Schedule: Daily at 9:00 AM EST

4.8 Behavioral Signal Framework (Threat Confidence Score)

Signal Category	Key Indicators	Weight in TCS
Account Authenticity	Age vs. follower ratio; posting cadence; linguistic consistency	High (25%)
Network Coordination	Cross-account posting timing; shared linguistic fingerprints; coordinated follow/unfollow	Critical (30%)
Content Manipulation	Copy-paste ratios; AI-generated text probability; fake testimonial structures	High (20%)
Engagement Fraud	Like/view/comment ratios; bot comment fingerprints; velocity vs. account age	Medium (15%)
Cross-Platform Correlation	Same campaign signatures across 3+ platforms within <6hrs; operator reuse	Critical (10% multiplier)

5. Phone Identifier

The Phone Identifier module extends AgenticBro's protection to the voice channel — the fastest-growing attack vector in consumer financial fraud. With \$39.5 billion lost globally to phone scams in 2024, real-time phone number risk scoring is no longer optional for a complete security stack.

5.1 The Phone Scam Problem

\$39.5B	68%	2.4s	33%
Lost to phone scams (2024)	Scam calls use spoofed numbers	Avg time before victim engages	Victims who never report

- **Trust Exploitation:** Scammers impersonate government agencies (IRS, SSA), banks, and tech companies. Victims comply because the caller sounds authoritative and possesses partial personal data — often sourced from prior data breaches.
- **Urgency Engineering:** Calls create artificial time pressure ("your account will be suspended in 2 hours") that prevents victims from verifying claims through independent channels.
- **Gap in Current Solutions:** STIR/SHAKEN attestation only validates carrier legitimacy, not caller intent. CNAM databases are stale and unpurchased by most carriers. No mainstream security tool provides real-time behavioral risk scoring for arbitrary phone numbers.

5.2 How It Works — 4-Step Pipeline

Step	Stage	Description
1	VALIDATION	Number normalization and format validation. E.164 parsing, country code extraction, line type detection (mobile/landline/VoIP/toll-free). Invalid numbers rejected before pipeline entry.
2	CARRIER LOOKUP	Real-time carrier and line type resolution. VoIP numbers receive baseline elevated risk. Premium rate numbers (900-, 976-) flagged immediately. Carrier reputation cross-referenced against known spam registries.
3	THREAT INTEL	Multi-source intelligence aggregation: community spam reports, regulatory complaint databases (FTC, FCC), known scam number registries, and AgenticBro's own scammer database cross-reference. Temporal scoring — recent reports weighted 3x over 90-day-old reports.
4	RISK SCORING	12-flag weighted scoring model produces a 90-point raw score normalized to 0–10. Risk level classified as LOW / MEDIUM / HIGH / CRITICAL. Structured JSON report returned with full flag breakdown, recommended actions, and confidence interval.

5.3 90-Point Risk System — 12 Flags

Risk Flag	Points	Trigger Condition
Known Scam Number	25	Confirmed in scam report databases or AgenticBro DB
High-Frequency Spam Reports	20	50+ community spam reports in last 30 days
Government Agency Impersonation Pattern	20	Number pattern matching IRS, SSA, Medicare call signatures
Premium Rate Number	15	900-, 976-, or international premium prefix
Temporary / Burner Number Characteristics	12	VoIP-only, registered <30 days, single-use pattern indicators
Robocall Signature	10	Carrier-flagged autodialer pattern, sequential number scanning
Spoofed Caller ID Pattern	10	Geographic inconsistency between registrant and area code
Bank / Financial Institution Impersonation	10	Number mimics known bank call center formats (neighbor spoofing)
Multiple Complaint Categories	8	Reports span 3+ scam categories — indicates operation breadth
Cross-Database Appearance	8	Appears in 3+ independent scam registries
Moderate Spam Report Volume	5	10–49 community spam reports in last 30 days
Low Spam Report Volume	2	1–9 community spam reports — monitor only

Raw Score	Normalized	Risk Level	Recommended Action
0 – 30 pts	0.0 – 3.0	LOW	Safe to answer. No significant risk indicators detected.
30 – 50 pts	3.0 – 5.0	MEDIUM	Exercise caution. Do not provide personal or financial information.
50 – 70 pts	5.0 – 7.0	HIGH	High scam probability. Do not engage. Block recommended.
70 – 90 pts	7.0 – 10.0	CRITICAL	Confirmed scam operation. Block immediately. Report to FTC.

5.4 Real-World Case Studies

Case 1: Google Support Impersonation | CRITICAL — 8.6/10

Carrier: VoIP — Google Voice-spoofed

Community Reports: 3,241 total; 847 in last 30 days

Report Categories: Tech Support Fraud, Google Impersonation, Remote Access Scam

FTC Complaints: 142 formal complaints on file

Flags Triggered: Known Scam Number (+25), High-Frequency Spam Reports (+20), Robocall Signature (+10), Multiple Complaint Categories (+8), Cross-Database Appearance (+8) = 71 raw pts

Summary: Caller claimed to be Google Support warning about 'account compromise.' Script directed victims to install remote access software (AnyDesk), then accessed bank accounts. AgenticBro flagged number as CRITICAL on first community report — 4.1 hours before FTC complaint was filed.

Case 2: Legitimate Business | LOW — 1.2/10

Carrier: AT&T; Business Voice

Community Reports: 3 total (1 unconfirmed spam, 2 wrong number)

CNAM: Verified — Manhattan Medical Group

Registration: Active since 2009

Flags Triggered: Low Spam Report Volume (+2) = 2 raw pts

Summary: Established medical office in Manhattan. 3 reports reflect user errors (wrong number callbacks), not scam activity. Risk scoring correctly classified as LOW with high confidence. False positive rate validation: AgenticBro applies temporal weighting — isolated low-volume reports from 2+ years ago are discounted.

Case 3: Premium Rate Pump Scam | HIGH — 6.4/10

Carrier: Premium Rate Services (900 prefix)

Line Type: Premium Rate — billed at \$4.99/minute

Community Reports: 187 total; 89 in last 30 days

Script Pattern: Cryptocurrency 'hot tip' requiring caller to stay on line for extended briefing

Flags Triggered: Premium Rate Number (+15), Moderate Spam Reports (+5), Multiple Complaint Categories (+8), Spoofed Caller ID (+10), Burner Characteristics (+12) = 50 raw pts

Summary: Outbound robocall campaign directing targets to call back a 900-prefix number for 'exclusive BTC signal alerts.' Each callback billed at premium rate. Caller ID spoofed to appear as local area code.

5.5 Integration — Unified Scoring & Scammer DB Cross-Reference

Phone Identifier is not a standalone module — it is natively integrated with the full AgenticBro detection stack. Every phone scan triggers:

- **Scammer DB Cross-Reference:** The submitted number is queried against the 261+ entry Supabase scammer database. If a match exists, the record's verification level, known victims, and evidence links are appended to the scan response.
- **Profile Correlation:** If a scammer's X/Telegram profile was indexed with a phone number, cross-referencing is automatic. A crypto rug-pull scammer and their phone scam operation can now be linked in a single report.
- **Community Reporting Loop:** User-submitted phone reports feed the scoring model in real time. A number reported by 10+ users in a 24-hour window triggers automatic re-scan and alert distribution if score crosses CRITICAL threshold.
- **Unified Risk Dashboard:** Web3 wallet risk, social profile risk, and phone number risk are displayed in a single user-facing security dashboard at agenticbro.app.

6. API Architecture & Endpoints

6.1 Core API Endpoints

Method	Endpoint	Description	Version
POST	/api/v1/verify/profile	Full profile verification with authenticity scoring	v2.1
POST	/api/v1/scan/profile	Chrome CDP profile scan (Twitter primary)	v2.1
POST	/api/v1/scan/token	Token impersonation scan by contract address	v2.1
POST	/api/v1/phone/scan	Phone number risk scan	v2.1
POST	/api/v1/phone/report	Submit community phone report	v2.1
GET	/api/v1/scammers/search	Query the known scammer database	v2.1
POST	/api/v1/scammers/report	Submit a new scammer report	v2.1
GET	/api/v1/scans/:handle/latest	Get latest scan result for a handle	v2.1
POST	/api/v1/scan/wallet	Wallet risk scan (Solana address)	NEW v2.3
GET	/api/v1/wallet/:address/latest	Latest wallet scan result	NEW v2.3
POST	/api/website-deep-scan	Submit domain for deep scan (queued)	NEW v2.3
GET	/api/website-deep-scan?pending=true	Poll pending deep scan jobs	NEW v2.3
POST	/api/website-deep-scan (result)	Submit completed scan result	NEW v2.3

6.2 Authentication & Rate Limiting — Updated in v2.3

Tier	Monthly	Scans/Day	Phone/Day	Wallet/Day	Features
Token Holder	\$100 AGNTCBRO hold	50	10	25	Full report, token-gated access
Free	\$0	5	—	—	Basic scan, public DB query
Basic	\$29	50	10	10	Full report, email alerts
Pro	\$99	200	50 batch	100	Webhook alerts, batch scan, phone batch
Team	\$299	1,000	200 batch	500	Multi-seat, API key management
Enterprise	\$999	Unlimited	Unlimited	Unlimited	SLA, dedicated support, custom integrations

7. Scammer Database

The master scammer database contains 261+ confirmed entries — a 49% increase since v2.1 — maintained through automated CDP scanning, community reports, and manual verification. All entries are synchronized to Supabase for real-time API access. Wallet addresses are now cross-referenced with on-chain data.

7.1 Database Schema (15 Fields)

Field	Type	Description
Scammer Name	String	Display name or alias used by the scammer
Platform	Enum	X, Telegram, Facebook, Instagram, LinkedIn, Discord
X Handle	String	Twitter/X username (@handle)
Victims Count	Integer	Number of confirmed victims
Total Lost USD	Float	Estimated total victim losses in USD
Verification Level	Enum	VERIFIED / UNVERIFIED / PARTIALLY VERIFIED / HIGH RISK / PAID PROMOTER
Scam Type	Enum	Pump & Dump, Token Confusion, Wallet Drainer, Giveaway, etc.
Wallet Address	String	Known wallet(s) used to receive funds — cross-referenced with on-chain data
Evidence Links	URL[]	Screenshots, transaction hashes, social media archives
Scanner	String	Agent name (Jarvis / Jeevvs) that performed the scan

7.2 Sample Database Entries

Name / Handle	Platform	Scam Type	Score	Status
LUNA GREY (@22J27)	X/Twitter	Pump & Dump Promoter	10.0/10	VERIFIED
AGNT Markets	Solana/Pump.fun	Token Confusion — \$0 liquidity	7.0/10	HIGH RISK
AGNTC (BSC)	BSC	Token Confusion — 'Agentic' clone	6.0/10	HIGH RISK

8. Detection Performance

4.2hr	71%	~8%	92–95%
Avg Detection Lead Time	Rug Pull Pre-Detection	False Positive Rate	Red Flag Detection Rate

Metric	v2.1	v2.3	Notes
Scammers Indexed	175+	261+	49% growth since v2.1
Profile Scan Latency	~15s	~15s	Unchanged
CDP Extraction Accuracy	95%+	95%+	Unchanged
Phone Scan Latency (fresh)	<1.8s	<1.8s	Unchanged
Wallet Scan Latency	N/A	<3s	NEW — depends on RPC
Website Deep Scan Latency	N/A	30–60s	NEW — multi-source search
First Signal to Alert	<22min	<22min	Unchanged
API Response Time	<200ms	<200ms	Unchanged
False Positive Rate	~8%	~8%	Unchanged
Scan Surfaces	6	7	+Wallet
Automated Cron Pipelines	0	5	nightly_review, website-deep-scan, group-morning-vibe, group-evening-vibe, x-engagement-monitor
Token Impersonation Tokens Flagged	34	34+	From live scan data
Rug Pull Pre-Detection Rate (TCS > 75)	71%	71%	Unchanged
Cross-Platform Campaigns (3+ platforms)	94%	94%	Unchanged
Campaigns Tracked Simultaneously	340+	340+	Per Standard Node

9. Roadmap: Single Node to DePIN Network

The current single-node deployment is not a limitation — it is the proof of concept. Every core detection capability described in this document is running today. The path to the decentralized AgenticBro Protocol is an engineering scaling problem, not a research problem.

Phase	Timeline	Milestone	Status
Phase 1 — Foundation	Q1–Q2 2026	Single-node CDP scanning, profile verifier (85+ tests), token scanner, phone identifier, wallet transfer scanner, website deep scanner, X engagement monitor, local web search engine, 261+ scammer DB, REST API (10+ endpoints), 5 automated cron pipelines	COMPLETE
Phase 2 — Network	Q3 2026	AgenticBro Node Software v1: cross-platform installer, auto hardware detection, Ollama tier assignment, protocol token launch, Validator network activation	PLANNED
Phase 3 — Intelligence	Q4 2026	ABIG v2: cross-chain entity correlation, deepfake audio/video detection (Jeeevs v2), predictive campaign modeling, mobile alert app, real-time call screening	PLANNED
Phase 4 — Protocol	2027	DAO governance, cross-protocol intelligence sharing API standard, Jeeevs-as-a-Service enterprise API, regulatory intelligence layer, international phone coverage	VISION

The single-node architecture proves the detection methodology. A Mac Studio M4 and a Windows gaming rig with RTX 3080 — two completely different hardware stacks — already operate as a coordinated two-node detection network with shared intelligence. Scaling from two to two thousand is an engineering problem, not a hardware problem.

10. Competitive Differentiation

The security landscape has two gaps — on-chain analytics firms that cannot see the social layer, and centralized AI tools that cannot be trusted with sensitive behavioral intelligence. AgenticBro occupies the space between them: local inference, open architecture, and a behavioral focus architecturally impossible for blockchain-native tools to replicate.

Capability	AgenticBro v2.3	Chainalysis	CertiK	Pocket Universe	Manual Reporting
Real-Time Social Monitoring	✓	Partial	✗	✗	✗
Behavioral AI Analysis	✓	✗	✗	✗	✗
Cross-Platform Correlation	✓	✗	✗	✗	✗
Phone Number Risk Scoring	✓	✗	✗	✗	✗
Pre-Launch Detection	✓	✗	Rare	✗	✗

Token Impersonation Scanner	✓	Partial	✗	✗	✗
261+ Scammer Database	✓	Paid	✗	✗	✗
Wallet Transfer Scanning	✓	✓	✗	✗	✗
Website Deep Scan	✓	✗	✗	✗	✗
Automated Outreach Intelligence	✓	✗	✗	✗	✗
Local Web Search (API-free)	✓	✗	✗	✗	✗
Event Ticket Fraud Detection	✓	✗	✗	✗	✗
On-Chain Integration	Roadmap	Partial	✓	✗	✗

11. Risks and Mitigations

Risk	Description	Mitigation
Platform API Restrictions	Twitter/X or Discord restrict CDP/automation access, reducing signal coverage	Multi-method ingestion (RSS, community submissions, partner feeds); legal API partnerships
False Positive Reputation Risk	High-profile incorrect scam flag damages credibility or targets legitimate projects	Conservative public alert threshold (TCS > 75); 24-hr dispute window; DAO-governed challenge mechanism
Adversarial Adaptation	Sophisticated operators adapt behavior to evade Jeev's detection signatures	Continuous model retraining; ensemble model diversity; cross-node signal consensus requiring coordinated evasion
Single Node Dependency	Single point of failure if the operating machine goes offline	Docker container restart policies; Supabase cloud sync ensures data persists; Phase 2 multi-node architecture
Carrier Data Reliability	Carrier lookup APIs have uptime dependencies and may return stale data	Multi-provider carrier lookup with fallback chain; graceful degradation — score on available signals if carrier lookup fails
Phone Number Spoofing Arms Race	Scammers rotate numbers to evade databases	Behavioral fingerprinting supplements number-based scoring; infrastructure correlation identifies operators even as they rotate numbers
RPC Endpoint Dependency	Wallet scanner relies on Solana RPC availability; Chainstack outage could block wallet scans	Multi-RPC load balancer (Chainstack primary, public fallback); graceful degradation to balance-only mode
Web Search Rate Limiting	DDG/SearXNG may rate-limit or CAPTCHA automated scrapers	UA rotation, 1hr result cache, 3-engine fallback chain (DDG → SearXNG → Google), CAPTCHA detection with automatic engine switch
Cron Pipeline Failures	5 automated cron jobs introduce operational complexity	Each job has timeout limits, consecutive error tracking, and delivery failure alerts; nightly review monitors system health
Ticket Site False Positives	Event ticket scanner may flag legitimate resale platforms	Domain age analysis, SSL verification, payment method review, FIFA/partner whitelist cross-reference

NEW IN v2.3

Appendix A: Local Web Search — API-Free Intelligence Pipeline

AgenticBro v2.3 introduces a self-hosted web search capability that eliminates dependency on rate-limited third-party search APIs (Brave, Google Custom Search). The local search engine scrapes DuckDuckGo, SearXNG, and Google directly with UA rotation and CAPTCHA detection.

Architecture

Component	Description
Primary	DuckDuckGo HTML scraping (no API key needed)
Fallback 1	SearXNG public instances (federated, decentralized)
Fallback 2	Google search scraping (highest coverage)
Cache	File-based, 1-hour TTL, content-hash deduplication
UA Rotation	Randomized User-Agent strings to avoid bot detection
CAPTCHA Detection	Pattern matching for known CAPTCHA HTML markers — graceful fallback to next engine

CLI: bash /workspace/scripts/local-web-search.sh "query" [--count N] [--no-cache]

Integration: Powers X Engagement Monitor tier-2 search, Website Deep Scanner, and any future pipeline requiring web intelligence without API cost or rate limits.

12. Conclusion

The \$1 billion social engineering crisis in Web3 is not a technical failure. It is a failure of visibility. The attack surface is human — played out across Discord channels, Twitter threads, Telegram groups, YouTube Shorts, phone calls, and fraudulent websites. No amount of smart contract auditing or blockchain analytics will solve a problem that happens entirely before a single on-chain transaction occurs.

AgenticBro v2.3 is the working answer to this problem, deployed today on a single node. The Chrome CDP scanner extracts real profile data at 95%+ accuracy. The profile verifier engine has 85+ passing tests. The token impersonation scanner identified 34+ suspicious tokens in live scans. The Phone Identifier scores any phone number against 12 risk flags in under 2 seconds. The Wallet Transfer Scanner provides real-time on-chain exposure data for any Solana address. The Website Deep Scanner performs multi-source reputation analysis on arbitrary domains. The X Engagement Monitor delivers daily scam victim intervention targets. The scammer database holds 261+ confirmed entries. The REST API is live on port 3002 with 10+ endpoints. Five automated cron pipelines run continuously. This is not a whitepaper for a concept — it is documentation for a running system.

ONE SHIELD. TOTAL PROTECTION.

Web3 · Social Layer · Phone · Token Markets · Websites · Wallets

Protecting you from every type of scam — across every surface.
